PLUS Search Results for S/N 09720589, Searched February 10, 2005

The Patent Linguistics Utility System (PLUS) is a USPTO automated search system for U.S. Patents from 1971 to the present. PLUS is a query-by-example search system which produces a list of patents that are most closely related linguistically to the application searched. This search was prepared by the staff of the Scientific and Technical Information Center, SIRA.

### Abstract:

Conventional file systems are unable to guarantee that clients can access continuous media in a way that permits delivery deadlines to be met under normal buffer conditions. This is due to the fact that magnetic disks and optical disks have fixed and rotational latencies that can cause a continuous media client to starve if the continuous medium is not buffered and coordinated with other service requests. Therefore, finding a way to support continuous retrieval of multimedia data at the required bandwidth and a way to store the multimedia data is challenging tasks. The most important challenges in a Video-On-Demand system is to support interactive browsing functions such as fast forward and fast backward. There are several approaches to implementing these functions which require additional resources, storage space, network bandwidth or a set of scalable data compression algorithms. In this paper, we propose an efficient strategy to support continuous display of multiple objects at different display speed rates, simultaneously, without any additional
